Often found in the aisles of big retail stores, the scissor lift is a platform together with wheels. It works similar to a forklift. The scissor lift got its name from the unique design which raises its platform in the air. The platform raises as the attached, folding supports below are drawn together, in scissor-like fashion, propelling it upward. At its tallest height, a scissor lift could extend from 6.4 to 18.8 meters in the air depending on the kind. An electric or hydraulic motor are used to propel the platform in the air, moving faster in the middle of the lift and slower at the end.

Some improvements in materials and safety have been made ever since that time. Newer types of scissor lifts could travel over the uneven ground of a construction site or a smooth floor of a warehouse. The unit was designed to help productivity in the many retail establishments which were growing larger. Compared to the forklift, the scissor lift is more portable and more helpful in retail settings. They are the only industrial platforms which could be retracted and fit into a relatively small storage place.
