

Manlift Certification Hamilton

Manlift Certification Hamilton - The Elevated Platforms and Manlifts Certification program helps to provide the needed training on the safe operating procedures, work practice, rules and regulations regarding the daily activities for the operators of this equipment. The program has been designed for individuals who are actively involved in these activities or those who have a basic knowledge of this equipment.

In the past couple of decades, manlifts and aerial platforms have become a common sight on construction job sites and in industrial maintenance applications. These machinery provide an easy way to lift staff near what should be done on a stable platform apparatus, allowing employees to do tasks with greater comfort and safety rather than being perched on top of ladders or scaffoldings.

Similar to every other tool, manlifts are only safe when they are used correctly. Because they elevate employees above floor or ground level, accidents can happen easily and this might lead to serious fatalities or injuries for both the manlift operators and any passerby who may not be lucky enough to be standing underneath.

There are various kinds of manlifts. Nearly all fall into 1 of 2 categories: the articulating boom lift, that has the capability of both horizontal and vertical movement and the scissors lift, that is capable of moving up and down.

Protecting Workers

Proper training is very important in regard to safety matters. Many of the businesses which rent manlifts would provide training at the jobsite. Each worker who would be working on the machinery or operating it must receive training in safe operations. It is likewise important that only those workers who have received training should be authorized to operate the controls. Communication rules and operating procedures should be clear. Hence, employees on the ground should not operate controls without the knowledge and approval of any workers inside the basket.

Those workers who would be occupying the basket are required to wear proper fall protection like for instance lanyard and a harness. That protection should be attached to the manlift itself and not to a surface nearby. The employee should ensure that he or she has made whatever adjustments required to reflect the change in fall distance if the height of the work area changes.

Manlifts must be inspected and tested every day to make certain they are in safe operating condition. Prior to the machinery being used, whatever defects must be re-checked and fixed.
