If you are looking for a job as a forklift operator, our regulatory-compliant forklift training Schools offer exceptional instruction in numerous types and styles of lift trucks, lessons on pre-shift inspection, fuel kinds and handling of fuels, and safe operation of a forklift. Practical, hands-on training helps individuals participating in obtaining fundamental operational skills. Course content covers current rules governing the utilization of forklifts. Our proven forklift courses are designed to offer training on these kinds of trucks: counterbalanced forklift, powered pallet trucks and narrow isle forklift.

Do not lower or raise the fork while the lift truck is traveling. A load must not extend higher than the backrest because of the danger of the load sliding back in the direction of the operator. Inspect for overhead obstacles and ensure there is sufficient clearance prior to raising a load. Stay away from overhead power lines. Once the load is lifted straight up, tilt it slightly back.

When the load is lifted the lift truck would be less stable. Make certain that no pedestrians cross under the elevated fork. The operator must not leave the forklift when the load is lifted.

When handling pallets, forks should be level and high enough to go into the pallet and extend all the way beneath the load. The width of the forks should provide even distribution of weight.

Before unloading or loading the truck, chock the wheels and set the brakes. Floors should be strong enough to support the weight of the load and the forklift combined. Fixed jacks can be installed to support a semi-trailer that is not coupled to a tractor. The height of the entrance door should clear the forklift height by a minimum of 5 cm. Mark edges of ramps, docks or rail cars and avoid them.
